

## User guide:

Users start off on the site by seeing the current shipments that are going on, you are able to see the name, tracking number, trailer number, destination, total time, time remaining, start date. All important information when tracking shipments, and also trying to follow regulations.

If you would like to create a new shipment, first click on create new shipment, you are granted with all of the start and end points provided in the json file. Then you enter a start point of where the shipment will start. After that you must click on 1 of the end points to see where you could possibly end. After that you will need to enter a time which will be needed when calculating the regulations of how long a trucker can go everyday, and for how long every week. When creating a shipment, you will need a driver, which is why we have a driver with their designated id next to their name, After clicking on a designated driver, you must choose a tail trailer, some trailers are not able to hold a tail trailer which is shown in the selection, for example, 1002 w/ trailer 2002 and 3002, which means truck unit number 1002, and trailer 2002, with tail trailer 3002. After that click submit, and it should add the values to the table which will show at the top of your screen.

When estimating time, you must click on the time estimation tab, then you must enter the starting location, following after you must enter an end location, which will then calculate the time based on a given speed.
